Intro

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

- Concerned with how classes are composed to form larger structures.
- We have *class patterns* (inheritance), and *object patterns* (composition)
- Many of these patterns are related, and some of them we can find in others (hence their ordering)

Adapter

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

- What is an **adapter**? (non CS explanation)
- Why do we need them?
- Adapter allows classes with incompatible interfaces to work together (without source code changes)

Adapter pattern

Convert the interface of a class into another interface expected by clients.

Adapter

Lecture 03

Lect. PhD.
Arthur Molnar

Structural
Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Motivating example:

- Let's consider a drawing editor for lines, polygons, ...
- The editor works with a *Shape* abstract base class
- Concrete elements subclass *Shape* (e.g. *LineShape*, *RectShape*, etc)
- *TextShape* is more interesting, as its implementation is more difficult
- Luckily (!), we've got a GUI library providing a *TextView* class - it's just what we need, but *Shape* and *TextView* don't know each other

Adapter

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

What to do, what to do?

- 1 Change *TextView* to conform to *Shape*? (why, **why not?**)
- 2 Introduce an adapter between the seemingly unrelated classes - enter *TextShape*

Adapter

Two possible implementations - **object adapter**

Figure: From[1]

Adapter

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

- 1 Clients call the *Adapter*, and it calls *Adaptee* operations in turn
- 2 Class adapters commit to a concrete *Adaptee* class, less flexibility when we want to adapt *Adaptee* subclasses
- 3 Your mileage may vary based on difference between *Target* and *Adaptee*
- 4 Two-way adapters can be created, making both *Target* and *Adaptee* work with each other

Adapter

Lecture 03

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

- When an abstraction can have multiple implementations, we usually use inheritance, using *interfaces* or *abstract base classes*
- Inheritance glues abstraction and implementation together

Bridge

Lecture 03

Lect. PhD.
Arthur Molnar

Structural
Patterns

Intro
Adapter
Bridge
Composite
Decorator
Façade
Flyweight
Proxy

Motivating example:

- Implementation of a *Window* abstraction for a GUI toolkit
- We want it to work on multiple platforms (e.g. *X Window System* and *IBM Presentation Manager*)
- Define abstract *Window* class and subclass it:
 - Results in *XWindow* and *PMWindow*
 - Classes that extend *Window* have to be implemented in both frameworks
 - Client code is platform dependent

Figure: From [1]

Bridge

Lecture 03

Figure: From [1]

Bridge

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Façade

Flyweight

Proxy

- *Bridge* separates the abstraction and its implementation into separate class hierarchies
- We have a *WindowImp* class as a platform agnostic root class
- *Window* subclass operations are implemented in terms of abstract operations in *WindowImp*.
- The **bridge** exists between *Window* and *WindowImp*, and it is between abstraction and implementation

Bridge

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

General case:

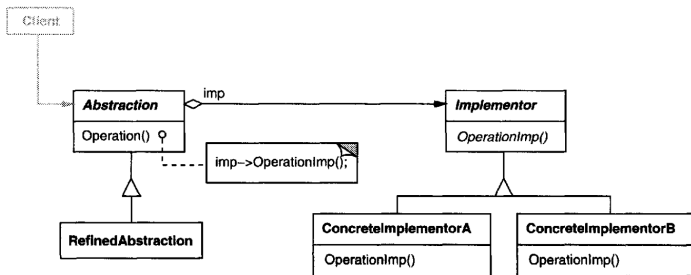

Figure: From [1]

Bridge

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

When and how to use:

- Decouple interface and implementations; this allows you to vary the implementation at run-time (e.g. use *Swing*, *JavaFX* or *SWT* windows)
- A proliferation of classes, such as in the first example
- Decision about which implementation to use can be taken using a *Factory* approach in the *Window* class constructor

Bridge example code

Lecture 03

Composite

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Composite pattern

Compose objects into tree structures to represent part-whole hierarchies. Clients treat compositions and individual objects uniformly.

Composite

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Motivating example:

- Let's consider a graphical editor, supporting lines, shapes, text and pictures
- Components can be grouped to form larger components (**e.g.** shape built using multiple lines)
- Treating all components the same way simplifies *client* code greatly
- **The key:** use an abstract class to represent both *primitive components*, as well as *compositions*

Composite

Lecture 03

Lect. PhD.
Arthur Molnar

Structural
Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Motivating example:

- *Graphic* class includes operations for management of its children
- *Line*, *Rectangle*, *Text* are primitive components, and can draw themselves using *Draw()*
- Primitive classes do not have children by definition
- *Picture* defines an aggregation of *Graphic* objects, and can be used recursively

Figure: From [1]

Composite

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Façade

Flyweight

Proxy

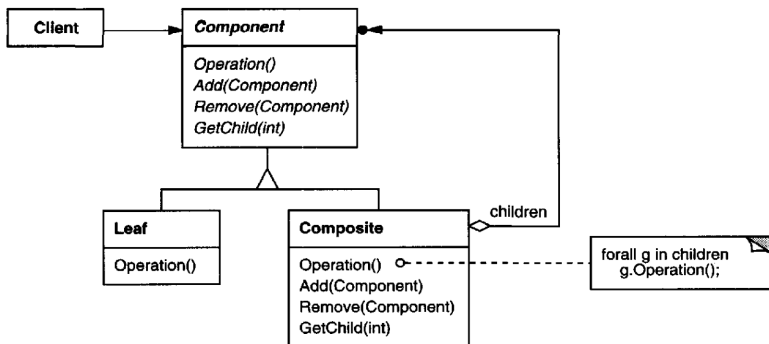

Figure: General case (from [1])

Composite

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Façade

Flyweight

Proxy

Consequences:

- + Simplifies clients, as they no longer care about the exact type of object they have
- + New leaves can be added without additional changes
- Design might be too general, as you cannot restrict composite components (**e.g.** GUI widget hierarchies in the abstract factory pattern that cannot be mixed between platforms)

Composite

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Implementation details:

- Children can also have a reference to parent, managed by *Component*
- Maintain the invariant of the parent-child relationship
- Where to define management of children?
 - **Component class**: transparent, as all classes are treated the same, but not safe, as operations on children don't make sense for leaves
 - **Composite class**: opaque, as it hidden by the component class, but safer
- Tension between maximizing the *Component* interface (generally good) and the types of leaves that can be added
- How do you know whether a component is a *Composite* without casting?

Composite example code

Lecture 03

Decorator

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Decorator pattern

Attach additional responsibilities to an object dynamically

- Dynamically means at runtime
- Most flexible, much more than inheritance

Figure: Decorator example (from [1])

Decorator

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

- Suppose we have a GUI component that does not support scrolling or borders (can you provide examples?)
- Sometimes we will need these additional behaviours, but not every time
- We wrap our component into a *decorator* that forwards components messages and adds its own behaviour
- Decorators are transparent to clients and can be chained recursively

Decorator

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro
Adapter
Bridge
Composite
Decorator
Façade
Flyweight
Proxy

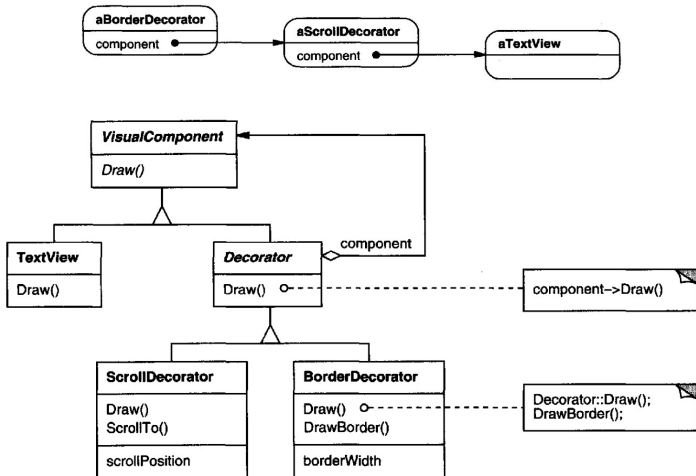

Figure: Decorator examples (from [1])

Decorator

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

When to use:

- Add responsibilities to individual objects transparently
- These responsibilities can be withdrawn dynamically
- When subclassing is impractical (**e.g.** result in a large number of classes, class definitions unavailable)

Decorator

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

- + More flexible than inheritance (**e.g.**
BorderBorderScrollablePanel ?)
- + Only add what you need by composition
 - Decorators are transparent but not equal to the decorated object (don't use object identity)

Decorator

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Decorator versus *Strategy*:

- Decorator changes the skin
- Strategy changes the internals (**e.g.** a *List* class might implement the strategy pattern for sorting it)

Façade

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Façade

Flyweight

Proxy

Façade pattern

Provide a unified interface to a set of interfaces in a subsystem.
Defines a higher-level interface through which the subsystem is easier to use

Façade

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Façade

Flyweight

Proxy

- Goal is to reduce apparent complexity
- Façade reduces the communication between systems - makes their interactions, and possibly the larger system, easier to understand

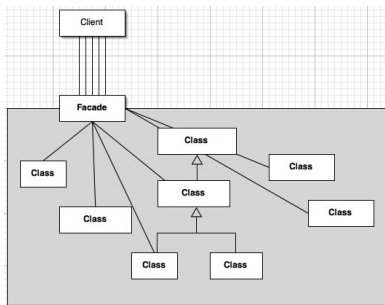

Figure: <https://www.javaworld.com/article/2073463/fa-231-ade-clears-complexity.html>

Example of a compiler:

- Compiler includes classes *Scanner*, *Parser*, **Node*, *NodeBuilder*, *CodeGenerator* and so on
- They all do something useful, and should be exposed
- If you implement an IDE plugin with syntax highlighting, auto-complete and incremental compiling all this comes in VERY handy
- What if you just want to compile the thing!?

Façade

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro
Adapter
Bridge
Composite
Decorator
Façade
Flyweight
Proxy

The *Compiler* class is the system façade

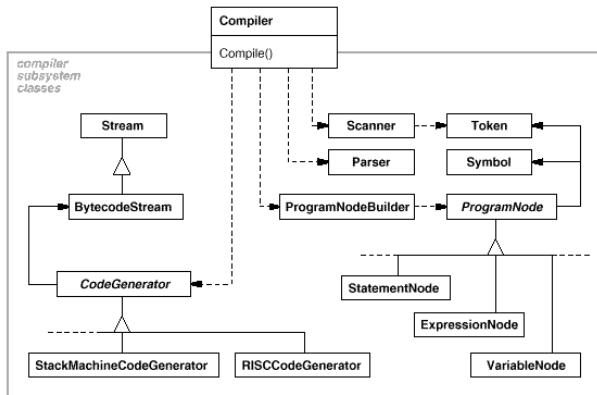

Figure: from [1]

Façade

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Façade

Flyweight

Proxy

When to use the façade pattern:

- Provide a simple, default view of a subsystem, "good enough" for most of its clients
- Reduce the number of dependencies between a subsystem and its clients
- Layer the subsystem - create façades as the entry point for each layer

Façade

Lecture 03

Lect. PhD.
Arthur Molnar

Structural
Patterns

Intro

Adapter

Bridge

Composite

Decorator

Façade

Flyweight

Proxy

Consequences:

- Shield clients from subsystems by providing a common access point for most (all?) subsystems
- Promote weak coupling, help organize a system
- You don't lose flexibility: all the nitty gritty is still there, if you need to use it

Implementation:

- You can create an abstract Façade, which you subclass depending on the view that is required by clients (**e.g.** one for compiling, one for syntax highlighting)

Façade example code

Lecture 03

Flyweight

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Flyweight pattern

Share data to support a large number of instances efficiently.

Flyweight

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

- Everything is an object leads to a useful representation in OO languages
 - If too many things are objects, you have too little memory 😊
 - **e.g.** **CellRenderer* classes in Java are implemented as Flyweights
- + Flyweight shares common attributes between instances to save memory
- More complex implementation, added coupling

Flyweight

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Motivating example - a 3D shooter game with particle effects

- Naive implementation uses a complete instance for each particle
- However, certain particle classes can share state (e.g. all *bullets* look alike)

Flyweight

Lecture 03

Flyweight

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Flyweight implementation:

- Realize that particle color and texture are constant for many particles
- Coordinates, movement vector are updated by the particle system

Flyweight divides instance state:

- **Intrinsic:** constant within the object, can be read but does not change
- **Extrinsic:** depends on flyweight context, is supplied from the outside

Flyweight

Lecture 03

Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Façade

Flyweight

Proxy

Use flyweight when **all** these are true:

- Application uses a large number of objects
- Storage requirements are high
- Large groups of objects can be replaced by a small number of shared objects
- Application does not depend on object identity
- Flyweights **might** trade storage requirements with computation requirements (no such thing as free lunch)
- Flyweights **definitely** trade simplicity for storage requirements

Flyweight

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Where do we store **extrinsic** state?

- In a different class, where else? 😊
- Extract extrinsic state to another object (**e.g.** *Context*)
- The class containing the extrinsic state together with the Flyweight represent a complete object
- Flyweight instances should be created using a **Factory** in order to centralize instance creation

Compiler example source code

git: `/src/ubb/dp/structural/FlyweightTreeExample.java`

Proxy pattern

Provide a surrogate or placeholder for another object to control access to it.

Why would you do that?

- Lazily load expensive resources (**e.g.** email client, database BLOBS, large object hierarchies)
- Restrict access to a resource (**e.g.** check whether caller has the correct credentials for access)
- The same *proxy* class can be used for different subjects, by *programming to an interface*

Proxy

Lecture 03

Lect. PhD.
Arthur Molnar

Structural
Patterns
Intro
Adapter
Bridge
Composite
Decorator
Façade
Flyweight
Proxy

- The **proxy** object replaces the **subject**
- It forwards calls to the subject, when required

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Adapter versus Bridge - fight! 😊

- + Provide flexibility using indirection
- + Forward requests from a different interface
- Adapter is usually employed after implementation, to connect distinct components, subsystems
- Bridge is created as a conscious decision at design time

Structural Patterns

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Composite versus Decorator

- + Composite and Decorator have similar structure
- Composite structures classes to be used uniformly
- Decorator allows you to add responsibilities by composition (without subclassing)

Structural Patterns

Lecture 03

Lect. PhD.
Arthur Molnar

Structural Patterns

Intro

Adapter

Bridge

Composite

Decorator

Facade

Flyweight

Proxy

Decorator versus Proxy

- + Provide a level of indirection to an object
- Proxy is not designed to add responsibilities
- Proxy is not designed to be applied recursively
