BERNSTEIN-TYPE OPERATORS ON TETRAHEDRONS

PETRU BLAGA, TEODORA CÂTINAŞ, AND GHEORGHE COMAN

Abstract. The aim of the paper is to construct Bernstein-type operators on tetrahedron with all straight edges and on tetrahedron with three curved edges defined by some given functions. We study the interpolation properties, the approximation accuracy (degree of exactness, precision set) and the remainder of the corresponding approximation formulas. The accuracy is also illustrated by numerical examples.

1. Introduction

In some previous papers were constructed and applied some interpolation operators on triangle with one curved edge respectively on tetrahedron with straight edges ([1, 6, 7, 8, 9, 12]), as well as Bernstein-type operators on triangle with all straight edges, respectively on triangle with one curved edge ([4, 5]). There were studied the interpolation properties and the accuracy of these operators respectively the remainders of the corresponding approximation formulas.

The order of an approximation operator $P$ is given by the degree of exactness ($\text{dex}(P)$) and by the precision set ($\text{pres}(P)$). Remind that $\text{dex}(P) = r$ if $Pf = f$ for all $f \in \mathcal{P}^n_r$ and there exists $g \in \mathcal{P}^n_{r+1}$ such that $Pg \neq g$, where $\mathcal{P}^n_r$ denotes the space of polynomials in $n$ variables of global degree at most $r$. The precision set of an approximation operator is the set of all monomials for which the approximation is exact [2].

Key words and phrases. Bernstein operator, product operator, Boolean sum operator, approximation accuracy, tetrahedron.
The goal of this paper is to study Bernstein-type operators on tetrahedrons with straight edges respectively with three curved edges given by functions.

2. Bernstein-type operators on tetrahedrons with straight edges

By affine invariance it is sufficient to consider only the standard tetrahedron $T_h$ with vertices $V_0 = (0, 0, 0)$, $V_1 = (h, 0, 0)$, $V_2 = (0, h, 0)$ and $V_3 = (0, 0, h)$, with three edges $\tau_1$, $\tau_2$, $\tau_3$ along the coordinate axes and with the edges $\Gamma_1$, $\Gamma_2$, $\Gamma_3$ (opposite to the vertex $V_0$). Also, one denotes by $\sigma_{012}$, $\sigma_{013}$, $\sigma_{023}$ and $\sigma_{123}$ the tetrahedron faces from the planes $V_0V_1V_2$, $V_0V_1V_3$, $V_0V_2V_3$ and $V_1V_2V_3$ respectively (see the left side of Figure 1).

![Figure 1. Tetrahedron with straight edges](image)

Let $\Pi_i$, $i = 1, 2, 3$, be the parallel planes to the tetrahedron faces that intersect the tetrahedron edges in three points and $T_i$, $i = 1, 2, 3$, be the triangles in which the planes $\Pi_i$, $i = 1, 2, 3$, intersect the tetrahedron faces respectively (see the right side of Figure 1).

2.1. Univariate operators. On each triangle one defines two Bernstein-type operators.

**Remark 1.** We shall study, in detail, only the Bernstein-type operators on the triangle $T_1$. For the triangles $T_2$ and $T_3$ there are obtained analogous results.
Let us consider the triangle $T_1$ (see Figure 2).

**Figure 2.** Triangle $T_1$

For the uniform partitions

$$\Delta^x_m = \left\{ \left( \frac{ih-y-z}{m}, y, z \right) \mid i = 0, m \right\}$$

and

$$\Delta^y_n = \left\{ \left( x, j \frac{h-x-z}{n}, z \right) \mid j = 0, n \right\},$$

of the intervals $[(0, y, z), (h-y-z, y, z)]$, $[(x, 0, z), (x, h-x-z, z)]$ respectively, one considers the Bernstein-type operators $B^x_m$ and $B^y_n$ defined by

$$(B^x_m F) (x, y, z) = \sum_{i=0}^{m} p_{m,i} (x, y, z) F \left( \frac{i(h-y-z)}{m}, y, z \right)$$

with

$$p_{m,i} (x, y, z) = \binom{m}{i} \left( \frac{x}{h-y-z} \right)^i \left( 1 - \frac{x}{h-y-z} \right)^{m-i}$$

and

$$(B^y_n F) (x, y, z) = \sum_{j=0}^{n} q_{n,j} (x, y, z) F \left( x, j \frac{h-x-z}{n}, z \right)$$

with
\[ q_{n,j}(x, y, z) = \binom{n}{j} \left( \frac{y}{h-x-z} \right)^j \left( 1 - \frac{y}{h-x-z} \right)^{n-j}, \]

where \( F \) is a real-valued function defined on \( T_h \).

**Theorem 2.1.** If \( F : T_h \to \mathbb{R} \) then:

(i) \( B_{xy}^m F = F \) on \( \sigma_{023} \cup \sigma_{123} \), \[ B_{yz}^n F = F \) on \( \sigma_{013} \cup \sigma_{123} \);

(ii) \( \text{dex}(B_{xy}^m) = \text{dex}(B_{yz}^n) = 1 \);

(iii) \( \text{pres}(B_{xy}^m) = \{ x^i y^j z^k \mid i = 0, 1; j, k \in \mathbb{N} \} \), \[ \text{pres}(B_{yz}^n) = \{ x^i y^j z^k \mid j = 0, 1; i, k \in \mathbb{N} \} \};

(iv) \( (B_{xy}^m e_{2jk})(x, y, z) = \left[ x^2 + \frac{x(h-x-y-z)}{m} \right] y^j z^k , \) \[ (B_{yz}^n e_{12k})(x, y, z) = \left[ y^2 + \frac{y(h-x-y-z)}{n} \right] x^i z^k , \] \( i, j, k \in \mathbb{N} \).

**Proof.** The relations

\[
p_{m,i}(0, y, z) = \begin{cases} 1, & \text{for } i = 0, \\ 0, & \text{for } i > 0; \end{cases}
\]

\[
p_{m,i}(h - y - z, y, z) = \begin{cases} 1, & \text{for } i = m, \\ 0, & \text{for } i < m; \end{cases}
\]

respectively

\[
q_{n,j}(x, 0, z) = \begin{cases} 1, & \text{for } j = 0, \\ 0, & \text{for } j > 0; \end{cases}
\]

\[
q_{n,j}(x, h - x - z, z) = \begin{cases} 1, & \text{for } j = n, \\ 0, & \text{for } j < n; \end{cases}
\]

imply that

\[
(B_{xy}^m F)(0, y, z) = F(0, y, z), \]

\[
(B_{xy}^m F)(h - y - z, y, z) = F(h - y - z, y, z),
\]

\[
(B_{yz}^n F)(0, y, z) = F(0, y, z), \]

\[
(B_{yz}^n F)(h - y - z, y, z) = F(h - y - z, y, z),
\]
and

\[ (B_{xy}^{m} F)(x, 0, y) = F(x, 0, z), \]

\[ (B_{xy}^{m} F)(x, h - x - z, z) = F(x, h - x - z, z), \]

i.e., the interpolation properties (i). Regarding the approximation accuracy, we have

\[ (B_{xy}^{m} e_{000})(x, y, z) = \sum_{i=0}^{m} p_{m,i}(x, y, z) = 1, \]

\[ (B_{xy}^{m} e_{100})(x, y, z) = \sum_{i=0}^{m-1} \binom{m-1}{i} \left( \frac{x}{h-y-z} \right)^{i} \left( 1 - \frac{x}{h-y-z} \right)^{m-1-i} \frac{(h-y-z)}{m} = x, \]

\[ (B_{xy}^{m} e_{200})(x, y, z) = \sum_{i=2}^{m} \binom{m}{i} \left( \frac{x}{h-y-z} \right)^{i} \left( 1 - \frac{x}{h-y-z} \right)^{m-i} \frac{(h-y-z)^{2}}{m} = \frac{(h-y-z)}{m}^{2} \]

\[ (B_{xy}^{m} e_{ijk})(x, y, z) = y^{j} z^{k} (B_{xy}^{m} e_{000})(x, y, z), \quad i = 0, 1, 2, \quad j, k \in \mathbb{N}, \]

respectively

\[ (B_{xy}^{m} e_{000})(x, y, z) = \sum_{j=0}^{n} q_{n,j}(x, y, z) = 1, \]

\[ (B_{xy}^{m} e_{010})(x, y, z) = y, \]

\[ (B_{xy}^{m} e_{12k})(x, y, z) = y^{2} + \frac{y(h-x-y-z)}{m}, \]

\[ (B_{xy}^{m} e_{ijk})(x, y, z) = x^{i} z^{k} (B_{xy}^{m} e_{010})(x, y, z), \quad j = 0, 1, 2, \quad i, k \in \mathbb{N}, \]

that are proved in the same way, which imply (ii)-(iv).

Let

\[ F = B_{xy}^{m} F + B_{xy}^{m} F \]

be the approximation formula generated by the operator \( B_{xy}^{m} \).
Theorem 2.2. If $F(\ast, y, z) \in C[0, h - y - z]$ then

$$\left| (R_{m}^{x}F)(x, y, z) \right| \leq \left( 1 + \frac{h}{2\delta \sqrt{m}} \right) \omega(F(\ast, y, z); \delta), \quad y + z \leq h,$$

where $\omega(F(\ast, y, z); \delta)$ is the modulus of continuity of the function $F$ with regard to the variable $x$.

Moreover, if $\delta = 1/\sqrt{m}$ then

$$\left| (R_{m}^{x}F)(x, y, z) \right| \leq \left( 1 + \frac{h}{2} \right) \omega(F(\ast, y, z); \frac{1}{\sqrt{m}}).$$

Proof. We have

$$\left| (R_{m}^{x}F)(x, y, z) \right| \leq \sum_{i=0}^{m} p_{m,i}(x, y, z) \left| F(x, y, z) - F\left( \frac{i h - y - z}{m}, y, z \right) \right|$$

$$\leq \sum_{i=0}^{m} p_{m,i}(x, y, z) \left( \frac{1}{\delta} \left| x - \frac{i h - y - z}{m} \right| + 1 \right) \omega(F(\ast, y, z); \delta)$$

$$\leq \left[ 1 + \frac{1}{\delta} \sum_{i=0}^{m} p_{m,i}(x, y, z) \left( x - \frac{i h - y - z}{m} \right)^{2} \right]^{1/2} \omega(F(\ast, y, z); \delta)$$

$$\leq \left[ 1 + \frac{1}{\delta} \sqrt{\frac{x (h - x - y - z)}{m}} \right] \omega(F(\ast, y, z); \delta).$$

Since,

$$\max_{T_{1}} \left[ x (h - x - y - z) \right] \leq \frac{h^{2}}{4}, \quad z \in [0, h],$$

we have

$$\left| (R_{m}^{x}F)(x, y, z) \right| \leq \left( 1 + \frac{h}{2}\sqrt{m} \right) \omega(F(\ast, y, z); \delta)$$

respectively (for $\delta = 1/\sqrt{m}$)

$$\left| (R_{m}^{x}F)(x, y, z) \right| \leq \left( 1 + \frac{h}{2} \right) \omega(F(\ast, y, z); \frac{1}{\sqrt{m}}).$$

We also have

$$\left| (R_{m}^{y}F)(x, y, z) \right| \leq \left( 1 + \frac{h}{2} \right) \omega(F(x, \ast, z); \frac{1}{\sqrt{m}}).$$

Theorem 2.3. If $F(\ast, y, z) \in C^{2}[0, h]$ then

$$(R_{m}^{x}F)(x, y, z) = \frac{x (h - x - y - z)}{2m} F^{(2,0,0)}(\xi, y, z),$$
BERNSTEIN-TYPE OPERATORS ON TETRAHEDRONS

for \(0 \leq \xi \leq h - y - z\); \(y, z \in [0, h]\), and

\[
\left| (R_{m}^{xy}F)(x, y, z) \right| \leq \frac{h^2}{8n} M_{200} F, \tag{6}
\]

where

\[
M_{ijk} F = \max_{T_h} \left| f^{(i,j,k)}(x, y, z) \right|.
\]

**Proof.** Since \(\text{dex} (B_{m}^{xy}) = 1\), by Peano’s kernel theorem, follows that

\[
(R_{m}^{xy}F)(x, y, z) = \int_{0}^{h-y-z} K_{200}(x, y, z; s) F^{(2,0,0)}(s, y, z) \, ds,
\]

where the kernel

\[
K_{200}(x, y, z; s) = (x-s) + \sum_{i=0}^{m} p_{m,i}(x, y, z) \left( i \frac{h-y-z}{m} - s \right)_+
\]

does not change the sign \((K_{200}(x, y, z; s) \leq 0, \ s \in [0, h - y - z])\). By mean value theorem, one obtains

\[
(R_{m}^{xy}F)(x, y, z) = F^{(2,0,0)}(\xi, y, z) \int_{0}^{h-y-z} K_{200}(x, y, z; s) \, ds
\]

\[
= -\frac{x(h-x-y-z)}{2m} F^{(2,0,0)}(\xi, y, z), \quad 0 \leq \xi \leq h - y - z.
\]

Now, the inequality of (4) implies (6).

\(\square\)

**Remark 2.** On the same way it is proved the evaluations of the remainder in the formula

\[
F = B_{m}^{xy} F + R_{m}^{xy} F
\]

i.e., for \(F(x, \ast, z) \in C[0, h - x - z]\)

\[
\left| (R_{m}^{xy}F)(x, y, z) \right| \leq \left( 1 + \frac{h}{2} \right) \omega \left( F(x, \ast, z); \frac{1}{\sqrt{n}} \right) \tag{7}
\]

respectively, for \(F(x, \ast, z) \in C^2[0, h]\)

\[
\left| (R_{m}^{xy}F)(x, y, z) \right| \leq \frac{h^2}{8n} M_{200} F \tag{8}
\]

on \(T_h\).

9
2.2. Product operators. Let $P_{mn} = B^x_mB^y_n$ and $Q_{nm} = B^y_nB^x_m$ be the products of the operators $B^x_n$ and $B^y_m$.

We have

$$(P_{mn}F)(x, y, z) = \sum_{i=0}^{m} \sum_{j=0}^{n} p_{m,i}(x, y, z) q_{n,j}\left(\frac{h-y-z}{m}, y, z\right) \times F\left(i\frac{h-y-z}{m}, j\frac{(m-i)(h-z)+iy}{mn}, z\right),$$

respectively

$$(Q_{nm}F)(x, y, z) = \sum_{i=0}^{m} \sum_{j=0}^{n} p_{m,i}(x, y, z) q_{n,j}\left(\frac{h-y-z}{n}, j\frac{h-x-z}{mn}, z\right) \times F\left(i\frac{(n-j)(h-z)+jx}{mn}, j\frac{h-x-z}{n}, z\right).$$

**Theorem 2.4.** If $F$ is a real-valued function defined on $T_h$ then

$$P_{mn}F = F$$

and

$$Q_{nm}F = F$$

on $\tau_3 \cup \sigma_{123}$.

**Proof.** Taking into account (1) and (2), one obtains

$$(P_{mn}F)(0, 0, z) = F(0, 0, z),$$

$$(P_{mn}F)(h-y-z, y, z) = F(h-y-z, y, z),$$

respectively

$$(Q_{nm}F)(0, 0, z) = F(0, 0, z),$$

$$(Q_{nm}F)(h-y-z, y, z) = F(h-y-z, y, z),$$

for all $y, z \in [0, h]$.

For the approximation error of the operators $P_{mn}^1$ and $Q_{nm}^1$, we have the following theorem.
Theorem 2.5. If $F(\bullet, \bullet, z) \in C([0,h] \times [0,h])$ then

$$\left| (F - P_{mn}^1)(x, y, z) \right| \leq (1 + h) \omega \left( F(\bullet, \bullet, z); \frac{1}{\sqrt{m}}, \frac{1}{\sqrt{n}} \right)$$  \hspace{1cm} (11)$$

and

$$\left| (F - Q_{mn}^1)(x, y, z) \right| \leq (1 + h) \omega \left( F(\bullet, \bullet, z); \frac{1}{\sqrt{m}}, \frac{1}{\sqrt{n}} \right)$$  \hspace{1cm} (12)$$

on $T_h$.

Proof. We have

$$\left| (F - P_{mn}^1)(x, y, z) \right| \leq \left[ \frac{1}{\delta_1} \sum_{i=0}^{m} \sum_{j=0}^{n} p_{m,i}(x, y, z) q_{n,j} \left( \frac{h - y - z}{m}, y, z \right) \times \right.$$  

$$\left. \times \left| x - i \frac{h - y - z}{m} \right| + \frac{1}{\delta_1} \sum_{i=0}^{m} \sum_{j=0}^{n} p_{m,i}(x, y, z) q_{n,j} \left( \frac{h - y - z}{m}, y, z \right) \times \right.$$  

$$\left. \times \left| y - j \frac{(m - i) (h - z) + iy}{mn} \right| \right] \omega (F(\bullet, \bullet, z); \delta_1, \delta_2) \leq \left( \frac{1}{\delta_1} \sqrt{\frac{x(h - x - y - z)}{m}} + \frac{1}{\delta_2} \sqrt{\frac{y(h - x - y - z)}{n}} + 1 \right) \omega (F(\bullet, \bullet, z); \delta_1, \delta_2).$$

As,

$$x(h - x - y - z) \leq \frac{(h - y - z)^2}{4} \quad \text{on} \quad [0, h - y - z],$$

$$y(h - x - y - z) \leq \frac{(h - x - z)^2}{4} \quad \text{on} \quad [0, h - x - z],$$

one obtains

$$\left| (F - P_{mn}^1)(x, y, z) \right| \leq \left( \frac{1}{\delta_1} \frac{h - y - z}{2\sqrt{m}} + \frac{1}{\delta_2} \frac{h - x - z}{2\sqrt{n}} + 1 \right) \omega (F(\bullet, \bullet, z); \delta_1, \delta_2) \leq \left( \frac{1}{\delta_1} \frac{h}{2\sqrt{m}} + \frac{1}{\delta_2} \frac{h}{2\sqrt{n}} + 1 \right) \omega (F(\bullet, \bullet, z); \delta_1, \delta_2).$$

Now, for $\delta_1 = 1/\sqrt{m}$ and $\delta_2 = 1/\sqrt{n}$, one obtains (11). The inequality (12) is proved in the same way. \qed
2.3. Boolean sum operators. Let
\[
S_{mn}^1 := B_{xy}^y \oplus B_{yx}^x = B_{xy}^y + B_{yx}^x - B_{xy}^y B_{yx}^x
\]
and
\[
T_{nm}^1 := B_{yx}^x \oplus B_{xy}^y = B_{yx}^x + B_{xy}^y - B_{yx}^x B_{xy}^y
\]
be the Boolean sums of the operators $B_{xy}^y$ and $B_{yx}^x$.

**Theorem 2.6.** If $F$ is a real-valued function defined on $T_h$ then
\[
S_{mn}^1 F = F \quad \text{and} \quad T_{nm}^1 F = F
\]
on $\sigma_{013} \cup \sigma_{023} \cup \sigma_{123}$.

**Proof.** We have:
\[
(B_{xy}^y F) (0, y, z) = F (0, y, z), \quad (P_{mn}^1 F) (0, y, z) = (B_{yx}^x F) (0, y, z)
\]
which imply that
\[
S_{mn}^1 F = F \quad \text{on} \quad \sigma_{023};
\]
\[
(B_{yx}^x F) (x, 0, z) = F (x, 0, z), \quad (P_{mn}^1 F) (x, 0, z) = (B_{xy}^y F) (x, 0, z)
\]
which imply that
\[
S_{mn}^1 F = F \quad \text{on} \quad \sigma_{013};
\]
and
\[
B_{xy}^y F = F, \quad B_{yx}^x F = F, \quad P_{mn}^1 F = F, \quad \text{on} \quad \sigma_{123}
\]
which imply that
\[
S_{mn}^1 F = F \quad \text{on} \quad \sigma_{123}.
\]
Analogously, it is proved that $T_{nm}^1 F = F$ on $\sigma_{013} \cup \sigma_{023} \cup \sigma_{123}$. \qed

**Theorem 2.7.** If $F \in C (T_h)$ then
\[
| (F - S_{mn}^1 F) (x, y, z) | \leq \left( 1 + \frac{h}{2} \right) \omega \left( F (\cdot, y, z) ; \frac{1}{\sqrt{m}} \right) + \left( 1 + \frac{h}{2} \right) \omega \left( F (x, \cdot , z) ; \frac{1}{\sqrt{n}} \right) + (1 + h) \omega \left( F (\cdot , z) ; \frac{1}{\sqrt{m}}, \frac{1}{\sqrt{n}} \right)
\]
on $T_h$. 

12
Proof. From the identity
\[ F - S^1_{mn} F = (F - B^xy_m F) + (F - B^yx_n F) - (F - P^1_{mn} F) \]
one obtains
\[ \left| (F - S^1_{mn} F) (x, y, z) \right| \leq \left| (R^xy_m F) (x, y, z) \right| + \left| (R^yx_n F) (x, y, z) \right| + \left| (F - P^1_{mn} F) (x, y, z) \right| \]
and from (3), (5), (11), the proof follows. \( \square \)

Remark 3. The same inequality is obtained for the error \( (F - T^1_{nm} F) (x, y, z) \) using instead of (11) the inequality (12).

3. Bernstein-type operators on tetrahedrons with three curved edges

One considers, also, the standard tetrahedron \( T_h \) with vertices \( V_0 = (0, 0, 0), V_1 = (h, 0, 0), V_2 = (0, h, 0) \) and \( V_3 = (0, 0, h) \), with three straight edges \( \tau_1, \tau_2, \tau_3 \) along the coordinate axes and with three curved edges \( \gamma_1, \gamma_2, \gamma_3 \) (opposite to the vertex \( V_0 \)), defined, respectively, by the one-to-one functions \( f_i \) and \( g_i \), where \( g_i \) is the inverse of the function \( f_i, i = 1, 2, 3 \). Also, one denotes by \( s_{012}, s_{013}, s_{023} \) and the tetrahedron faces from the planes \( V_0 V_1 V_2, V_0 V_1 V_3, V_0 V_2 V_3 \) and \( V_1 V_2 V_3 \) respectively, by \( s_{123} \) the curved faced (opposite to the vertex \( V_0 \)) (see the left side of Figure 3) and by \( t_i, i = 1, 2, 3 \), the triangles with one curved edge in which the planes \( \Pi_i, i = 1, 2, 3 \), intersect the faces of the tetrahedron \( T_h \), respectively (see left side of Figure 3).

Next, one considers the particular case when the face \( s_{123} \) is on the sphere \( x^2 + y^2 + z^2 = h^2 \), i.e., \( f_i (u) = \sqrt{h^2 - u^2} \) and \( g_i (v) = \sqrt{h^2 - v^2} \), \( i = 1, 2, 3 \) (see right side of Figure 3)

3.1. Univariate operators. One each triangle \( t_i, i = 1, 2, 3 \), one defines two Bernstein-type operators. We discuss here only on the triangle \( t_1 \) (Figure 4).

We have
\[ (B^xy_m F) (x, y, z) = \sum_{i=0}^{m} p_{m,i} (x, y, z) F \left( \sqrt{\frac{h^2 - y^2 - z^2}{m}}, y, z \right) \]
and

\[(B_{m}^{n,k}F)(x, y, z) = \sum_{j=0}^{n} q_{n,j} (x, y, z) F \left( x, j \sqrt{h^{2} - x^{2} - z^{2}} / n, z \right) \]

with

\[p_{m,i}(x, y, z) = \binom{m}{i} \left( \frac{x}{\sqrt{h^{2} - y^{2} - z^{2}}} \right)^{i} \left( 1 - \frac{x}{\sqrt{h^{2} - y^{2} - z^{2}}} \right)^{m-i},\]
BERNSTEIN-TYPE OPERATORS ON TETRAHEDRONS

respectively

\[ q_{n,j}(x, y, z) = \binom{n}{j} \left( \frac{y}{\sqrt{h^2 - x^2 - z^2}} \right)^j \left( 1 - \frac{x}{\sqrt{h^2 - x^2 - z^2}} \right)^{n-j}, \]

where \( F \) is a real-valued function defined on \( T_h \).

Following the way used in the Section 2 one can prove the corresponding theorems:

**Theorem 3.1.** If \( F : T_h \to \mathbb{R} \) then:

(i') \( B_{xy}^m F = F \) on \( s_{023} \cup s_{123} \),

\( B_{nx}^m F = F \) on \( s_{013} \cup s_{123} \);

(ii') \( \text{dex} (B_{xy}^m) = \text{dex} (B_{yx}^n) = 1 \);

(iii') \( \text{pres} (B_{xy}^m) = \left\{ x^i y^j z^k \mid i = 0, 1; j, k \in \mathbb{N} \right\}, \)

\( \text{pres} (B_{yx}^n) = \left\{ x^i y^j z^k \mid j = 0, 1; i, k \in \mathbb{N} \right\}; \)

(iv') \( (B_{xy}^m e_{2jk})(x, y, z) = \left[ x^2 + x \left( \frac{\sqrt{h^2 - y^2 - z^2} - x}{m} \right) \right] x^i z^k, \)

\( (B_{yx}^n e_{i2k})(x, y, z) = \left[ y^2 + y \left( \frac{\sqrt{h^2 - x^2 - z^2} - y}{n} \right) \right] x^i z^k, \ i, j, k \in \mathbb{N}. \)

Let

\[ F = B_{xy}^m F + R_{xy}^m F \]

be the approximation formula generated by the operator \( B_{xy}^m \).

**Theorem 3.2.** If \( F(x, y, z) \in C \left[ 0, \sqrt{h^2 - y^2 - z^2} \right] \) then

\[ \left| (R_{xy}^m F)(x, y, z) \right| \leq \left( 1 + \frac{h}{2\delta \sqrt{m}} \right) \omega \left( F(x, y, z); \delta \right), \ y + z \leq h, \]

respectively

\[ \left| (R_{xy}^m F)(x, y, z) \right| \leq \left( 1 + \frac{h}{2} \right) \omega \left( F(x, y, z); \frac{1}{\sqrt{m}} \right). \]

**Theorem 3.3.** If \( F(x, y, z) \in C^2 [0, h] \) then

\[ \left| (R_{xy}^m F)(x, y, z) \right| = - \frac{x \left( \sqrt{h^2 - y^2 - z^2} - x \right)}{2m} F^{(2,0,0)}(\xi, y, z), \]

for \( 0 \leq \xi \leq \sqrt{h^2 - y^2 - z^2}, y, z \in [0, h] \), and

\[ \left| (R_{xy}^m F)(x, y, z) \right| \leq \frac{h^2}{8m} M_{200} \omega. \]
Remark 4. Analogous results take place for the remainder in the approximation formula

\[ F = B_n^{yx} F + R_n^{yx} F. \]

3.2. Product operators. Let \( P_{mn} = B_m^{xy} B_n^{yx} \) and \( Q_{nm} = B_m^{yx} B_n^{xy} \) be the products of the operators \( B_m^{xy} \) and \( B_n^{yx} \), i.e.,

\[
(P_{mn} F)(x, y, z) = \sum_{i=0}^{m} \sum_{j=0}^{n} p_{m,i}(x, y, z) q_{n,j}(x, y, z) \times F\left(\frac{i\sqrt{h^2 - y^2 - z^2}}{m}, j\sqrt{(m^2 - i^2)(h^2 - z^2)} + i^2 y^2, z\right),
\]

respectively

\[
(Q_{nm} F)(x, y, z) = \sum_{i=0}^{m} \sum_{j=0}^{n} p_{m,i}(x, y, z) q_{n,j}(x, y, z) \times F\left(\frac{j\sqrt{h^2 - x^2 - z^2}}{n}, i\sqrt{(n^2 - j^2)(h^2 - z^2)} + j^2 x^2, z\right).
\]

Theorem 3.4. If \( F: T_h \to \mathbb{R} \) then

\[ P_{mn} F = F \quad \text{and} \quad Q_{nm} F = F \quad \text{on} \quad \tau_3 \cup s_{123}. \]

Theorem 3.5. If \( F(\cdot, \cdot, z) \in C([0,h] \times [0,h]) \), then

\[
|F - P_{mn} F)(x, y, z)| \leq (1 + h) \omega (F(\cdot, \cdot, z) ; \frac{1}{\sqrt{m}}, \frac{1}{\sqrt{n}})
\]

and

\[
|F - Q_{nm} F)(x, y, z)| \leq (1 + h) \omega (F(\cdot, \cdot, z) ; \frac{1}{\sqrt{m}}, \frac{1}{\sqrt{n}}).
\]

3.3. Boolean sum operators. If \( S_{mn} = B_m^{xy} \oplus B_n^{yx} \) and \( T_{nm} = B_m^{yx} \oplus B_n^{xy} \) are the Boolean sums of the operators \( B_m^{xy} \) and \( B_n^{yx} \), then we have:

Theorem 3.6. If \( F: T_h \to \mathbb{R} \) then

\[ S_{mn} F = F \quad \text{and} \quad T_{nm} F = F \quad \text{on} \quad s_{013} \cup s_{023} \cup s_{123}. \]

BERNSTEIN-TYPE OPERATORS ON TETRAHEDRONS

Theorem 3.7. If $F \in C(T_h)$ then

$$
| (F - S_{mn}F)(x, y, z) | \leq \left( 1 + \frac{h}{2} \right) \omega \left( F(\cdot, y, z); \frac{1}{\sqrt{m}} \right) \\
+ \left( 1 + \frac{h}{2} \right) \omega \left( F(x, \cdot, z); \frac{1}{\sqrt{n}} \right) \\
+ \left( 1 + h \right) \omega \left( F(\cdot, \cdot, z); \frac{1}{\sqrt{m}}, \frac{1}{\sqrt{n}} \right),
$$

and a similar inequality holds for the error $F - T_{nm}F$.
